

Abstract of the Invention

Ambient temperature curing coating composition comprising a polysiloxane having the formula:

wherein each R1 is selected from the group consisting of alkyl, aryl, and alkoxy  
5 groups having up to six carbon atoms, reactive glycidoxy groups, and  
OSi(OR3)<sub>3</sub> groups, wherein each R3 independently has the same meaning as  
R1, each R2 is selected from the group consisting of hydrogen and alkyl and  
aryl groups having up to six carbon atoms, and wherein n is selected so that the  
10 molecular weight of the polysiloxanes is in the range of from 500 to about  
2,000, an alkoxysilyl-functional acrylic polymer, and a curing catalyst.

The invention further relates to the preparation of an alkoxysilyl-functional  
acrylic polymer.
